Flexible Connections Offered

Capacity to Customers (C2C) offered for demand customers. Under a C2C connection contract, additional capacity can be released without the need to reinforce the network. This capacity is available when the network is running in normal conditions. During a fault or abnormal network activity, some or all of this additional capacity may need to be constrained until the network is reconfigured or repaired.

Generation with Export Limitation schemes are considered on a case by case basis. It is expected this will become more widespread when an ENA Engineering Recommendation for Export Limiting Schemes is produced, probably in the next 12 months.

Operate normally radial circuits in meshed configuration to increase capacity for both demand and generation.
