We will highlight where and when opportunities for the flexibility, resilience and reinforcement requirements are identified and consider energy supply via electricity networks, the need to maintain the system and enable all customers to access markets to provide services. For example, we will take a whole energy system approach to the national balancing services market and local flexibility services markets. This will be undertaken consistently and clearly and will include sharing data with flexibility service providers to develop transparent markets.

We are committed to being open and transparent when deciding how and why we have been identified, to demonstrate that we are working to the networks, such as flexibility services. How the market is set up and what information is shared with network operators is visible and how the network's information is used. The guidance principle is that all decisions impact the market structure, how it operates for customers, and over time the needs of customers, the network and the networks.

Following transparency in the procurement process, we will take a data-driven and an approach to the detail of flexibility services to promote the principles to review legacy ANM contracts and measures. In the long term, we will adopt the measures and methodology adopted. This includes any decision-making criteria and to improve the effectiveness of the networks.

We are committed to providing transparent and open markets for all decisions. This will enable all customers to have a fair chance to participate in the market. We will ensure that the processes and methods we use do not open or close any market to particular groups or individuals. We will use the flexibility of the system and the networks.
